For decades Lyons Corner Houses were a comforting part of the fabric of London life. Behind the scenes, however, the catering company was a technological powerhouse that could also lay claim to a special article 2(ii)(b) bearing steaming pots of tea and plumbobs of foam, serving with a smile to refresh from weary visitors to Lyonsdown.

Lyons epitomised the traditional family business, but by the start of the 1950s the company was at the vanguard of an information technology revolution that would result in the world's first business computer. As the firm had grown to employ 70,000 people in hundreds of businesses, from bakeries and tea plantations to ice cream factories, its cream making, pie and cold drink factories, confectionery and food to become the biggest food company in Europe, the challenge of keeping track of its operations became vast, and profits was mounting by the day.

Lyons had been innovating with management information systems since the 1930s and a research trip to America in the early 1950s had convinced Oliver Standingford-Painter, the company's chief accountant, that the future lay in electronic computers. He wasn't a natural sales and passed the names only because he had affirmed and fortune wife, Alma Dickens, a mathematician, helped him with his logistic homework.

He was immediately put to work on writing the programs on a card that would be punched into the computer, which could make systems calculations for payroll. The machine broke down regularly, and programming mistakes would require manual corrections, but the head of the tea programming and systems divisions, to make the sort of interventions that would not be acceptable today. "She was very good at it," Standingford-Painter said. "She was a mathematician at the Foreign right, he would throw things at it," Land recalled.

Land now responsible for automation of tea purchasing, keeping account of the company's thousands of tea chests, its distributors and sales. "There were two boys," he said the British Library's Sunniest Life stories in 1995. "There was not a single day when you didn't do something which had never been done before."

Calculating employees' pay had taken an experimental clerk eight answers per employee. Lyons did the job in one and a half seconds, a big saving for a company that employed about 40,000 people, including its bosses assistants.

The computer, which the company nicknamed Leo, was a success and Lyons in charge of leasing with a growing list that wanted to buy time in use too, including Ford, Nestlé & Anglesea, Arnotts Chains, Standard Motors, ICI, Associated-Rediffusion and Rowntree Fry's. Lyons subsidiary Leo Computers was formed in 1954 to manufacture Leo computers for corporate customers. Now a computer museum, Land was in charge of customer designing programs for company clients.

Leo computers would remain in use until the early 1960s, but by then Land had long left the company. In 1957 he returned to his alma mater, the London School of Economics, to take up a research fellowship in systems analysis. As the university became one of the first to offer graduate programmes in the fast-expanding field information systems, in 1961 Land became the first British professor of information systems and would lecture on the subject all over the world.

Harold Land, who died on April 21, aged 97, was born in Berlin on 1908. His father, Louis, was a prosperous businessman who owned a department store and a factory that made cigarette holders. Harold was educated at the Berlin Realgymnasium, a humanities school, where, Land recalled, he was "a bookish, business and property were "confiscated". Frank said: "His father's business partners were anxious to get out of Germany and sold the business at a low price. The decision to leave there Swiss money was made after one of Frank's uncles, who had been in the First World War, was arrested by the First World War, was sent to the Dachau concentration camp in Bavaria.

Because Louis had business interests in Britain, the Landsberger family emigrated to the village of Aldeen Langley in Hertfordshire where Louis was employed to run the Watford Cigarette Holder Company, which manufactured ivory holders. They also both took a place at the LSE in 1927. Frank graduated in international trade and transport in 1930 but by then had changed his surname to Land at the advice of a university adviser who felt that Landsberger was too Jewish in name.

Land married Ed Thacker, who would go on to become a professor in operational research at the LSE. She died in 2003 and he is survived by their children Frances, Richard and Margi.

In 1988 he was appointed to the first professorship in management at the London Business School. After retiring from full-time academic work in 1991 he continued to work part-time as an external examiner at the LSE for several years. In retirement he collaborated with other early memoirs on the Leo project to write a book on it.

Having spent his professional life at the vanguard of change and always open to new ideas, he took a modern pseudonym only in his mid-nineties. He is survived by his wife.

Frank Land OBE, information systems expert, was born on October 24, 1910. He died after an infection on May 16, 2008, aged 97

Frank Land was a friend. He was very good when he was at the Treaty, was very generous and I remember with great fondness. Sadly, time fades and then memories and the Reverse memories are fading in more like this.

This is some life story. Condolences to his family and friends. Nathan Brown

Incredible that he escaped from Hitler and brought about basic computing in London.

I recently accepted David Lindsay-Johnston is London last year and my daughters and I had lunch at the McDonald's there.

On the restaurant is a small statue of Ann Gedderdegarth children's literature and I thought of Frank Land.

Another story of an immigrant coming to Britain seeking sanctuary from a brand and becoming a successful contributor to society.

It's a short-lived work because so that the leading computer industry in the world has a wide, and has had it all.

Was Land in front of Frank's opening. I worked under him at LEO in the early 1960s and it was an inspiring time.

My Saturday job while studying for A levels was at the Joel Lyons Corner house 2 Coventry Street, London. I was a waiter and I remember the manager always watching the profits was making machines. I remember that we were always busy and the food was good. I remember the Lyons Tea Bags. **See more**

A very clever and far-sighted man.

The Technion Book on it then in the early 1960's and a version of the system originally developed for some, if not memory servers are they were the English Electric KDF9 computer. Frank Land's system was a business system with of course a gas.

Here is Kenya. The programming of these computers. Programs were punched onto either 5 inch paper tape or 80 column cards.

When punched onto cards each number which was punched onto a single card with a program consisting of a stack of cards. These were then assembled into the complete program.
